Making voice agents easier to build with clearer steps, guided setup, and testing before launch.

UX/UI Design Internship at Tierce India pvt Ltd.

MY ROLE	PROJECT TYPE	TOOLS	TIMEFRAME
Interaction design Information architecture	Internship assignment Voice AI platform	Figma	Assignment dates: 18th June to 18th July

01 / CONTEXT

An agent is configured. But is it ready to speak to customers?

What would make someone feel confident letting an AI agent speak to their customers?

This question shaped my second project during my internship at Tierce India Pvt. Ltd., where I designed an AI calling agent platform from scratch for a new product launch. My research helped me recognise that the challenge went beyond designing interfaces it meant addressing concerns about robotic voices, inappropriate responses and delays in conversation. While I designed the entire platform, this case study focuses on the decisions I made to bring clarity to setup and help users evaluate their agent before trusting it with customer calls.

02 / PROBLEM STATEMENT

"How might we help users confidently set up and test AI calling agents before customer calls?"

03 / THE SOLUTION

Designed a guided setup with voice previews and live testing, helping users hear, evaluate and refine their AI agent before customer calls.

How was the dashboard designed to make AI agent activity and performance clear?

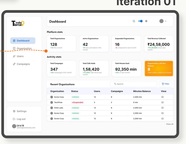

Before

Basic totals left agent activity unclear

Did not clearly explain what agents were doing now or had completed today.

Iteration 01

Organisation metrics overshadowed agent performance

Highlighted organisations, campaigns and revenue.

Final design

Surfacing Active Agents and Daily Call Activity

Added active-agent counts, call volume and recent calls.

Grouping Call Outcomes to Clarify Agent Performance

Research revealed: Users need to understand how calls went, including success rates, disconnections and customer sentiment.

How was the dashboard designed to make AI agent activity and performance clear?

Before

01 **Basic details** — Add the agent's details

02 **System prompt** — Define its instructions

03 **Select voice** — Choose how it sounds

04 **Knowledge base** — Gives its information

05 **Conversation opener** — Set how it starts the call

Competitor analysis revealed three gaps in the earlier flow:

- Missing call-type selection: No option to define inbound or outbound calls.
- Limited prompt guidance: Needed an easy way to paste or create detailed agent instructions.
- No testing step: Users could not check the agent's voice and responses before launch.

Final flow

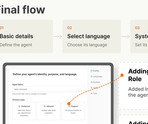

01 **Basic details** — Define the agent

02 **Select language** — Choose its language

03 **System** — Set its instructions

04 **Select voice** — Choose how it sounds

05 NEW **Test agent** — Try the conversation

Adding Call-Type Options to Define the Agent's Role

Added Inbound, Outbound and Support options to clarify whether the agent answers calls, initiates them or resolves issues.

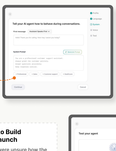

Adding a Purpose Field to Clarify What Users Want to Build

Let users describe their intended task in their own words, making the agent's purpose clear from the start.

Adding Tags to Simplify Prompt Creation

Competitor analysis revealed: Prompt writing needed more clearer guidance.

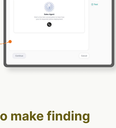

Added tags for tone and role to help users create instructions without starting from scratch.

Adding Live Testing to Build Confidence Before Launch

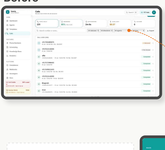

Research revealed: Users were unsure how the agent would sound and respond.

- Added live testing to let users experience the conversation before customer calls.

How were call filters redesigned to make finding specific calls easier?

Before

Similar Filters and Missing Details Made Calls Hard to Scan

- Filters looked alike, with no clear hierarchy.
- Agent type, call duration and cost were missing from the list.

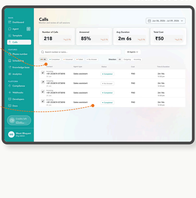

Final screen

Using Distinct Controls for Status and Direction

Used rounded status chips and a separate direction selector to distinguish filter groups.

Adding Agent, Cost and Duration Columns

Made it easier to compare who handled each call, when it happened, how long it lasted and what it cost.

Landing page design

Introduced Business Problems Before Presenting Solutions

- Highlighted real business challenges before introducing features.
- Connected each problem to how Vaanig AI solves it.

Highlighted Business Benefits Instead of Feature Descriptions

- Focused on the business value of each feature rather than just functionality.
- Communicated how features help businesses achieve their goals.

Outcomes & Project Status

During my summer internship at Tierce India Pvt. Ltd., I designed the AI calling agent platform, covering setup, live testing, performance monitoring and call management.

The product was under development during this period. Its impact is yet to be validated through implementation.
