01 / CONTEXT

During my summer internship at Tierce India Pvt. Ltd., I worked on redesigning a WhatsApp Business automation platform that helps businesses manage conversations, campaigns, automations and wallet credits.

As the platform covered multiple workflows, maintaining visual consistency and clearly communicating different system states became important. My focus was on building a reusable design system and refining the visual experience across the product.

While I contributed to the overall platform redesign, illustrations, motion graphics and website design, this case study focuses on the design system and its application to Wallet and Campaigns, where I explored clearer information hierarchy, component states and contextual actions.

My Contributions

01 **Design system**
Built 60+ reusable components for UI consistency.

02 **Wallet flow redesign**
Improved credit visibility and recharge controls.

03 **Campaign redesign**
Simplified campaign cards, metrics and status indicators.

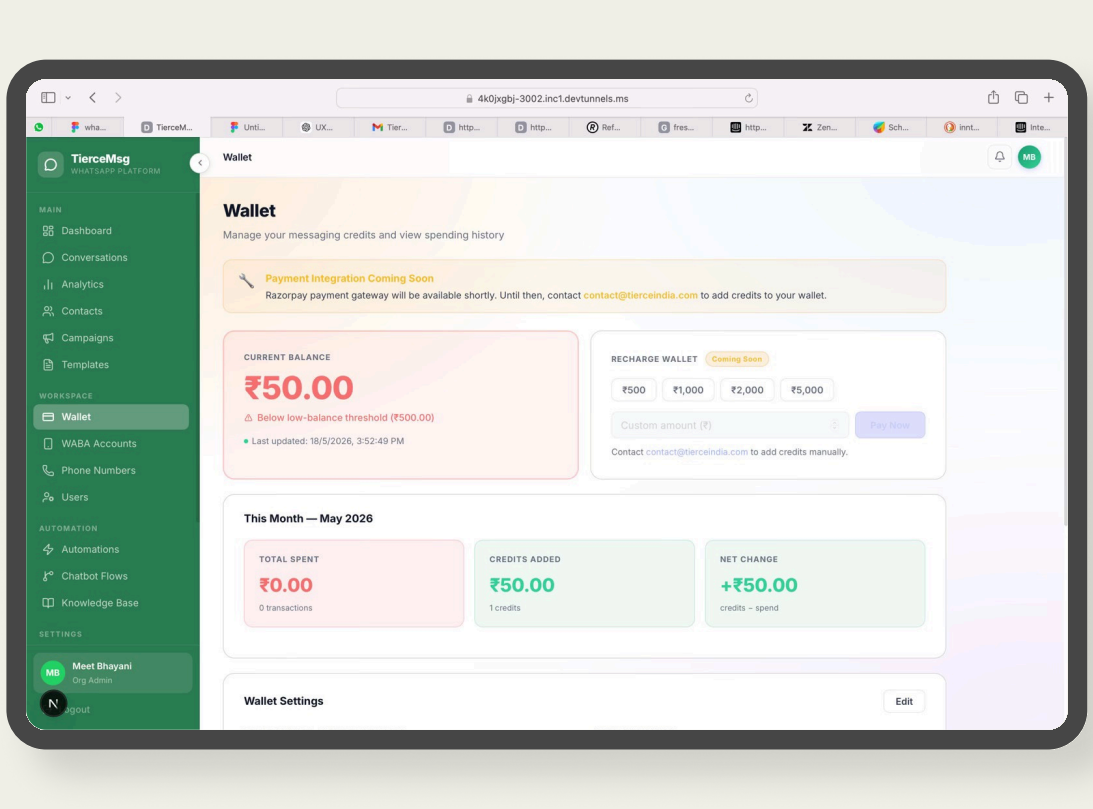
04 **Mascot design**
Created a friendly, approachable brand mascot.

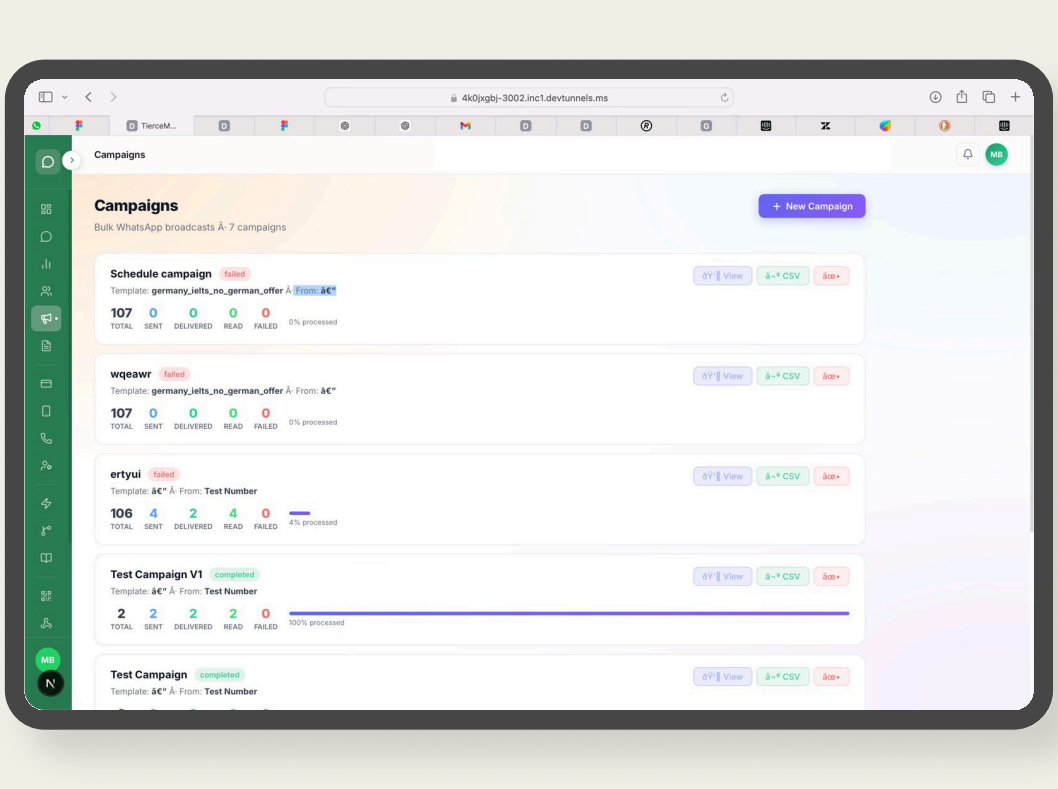
05 **Motion graphics**
Animated product workflows for feature explainers.

02 / PROBLEM STATEMENT

> *“How might we help businesses clearly track campaign progress and manage wallet credits through a consistent design system?”*

What does the current scenario look like?





1 **Inconsistent UI across screens**
Buttons, cards, spacing and visual styles varied across the platform, making the experience feel disconnected.

2 **Lack of visual hierarchy**
Important information was difficult to scan due to unclear priorities and inefficient use of screen space.

3 **Confusing information architecture**
Related features were difficult to locate, with billing functions split across two separate tabs.

4 **Unclear system states**
Wallet conditions and campaign statuses lacked clear visual differentiation, making it harder to identify what needed attention.

The solution

A consistent, clearer WhatsApp automation experience

A scalable design system, well defined screen states, and simplified workflows across key platform features.

Scalable Design System
Built 60+ reusable components with consistent typography, spacing, colours and interaction patterns.

Clear Screen States
Defined empty, active, loading, success and error states to guide users through every step.

Simplified Wallet Management
Organised balance, recharge, transactions and auto recharge into one clearer billing experience.

Intuitive Campaign States
Made campaign status, progress and available actions easier to understand and manage.

Improved Visual Hierarchy
Restructured dense layouts to highlight key information and make screens easier to scan.

Consistent Navigation & IA
Grouped related features and streamlined navigation to make important tasks easier to find.

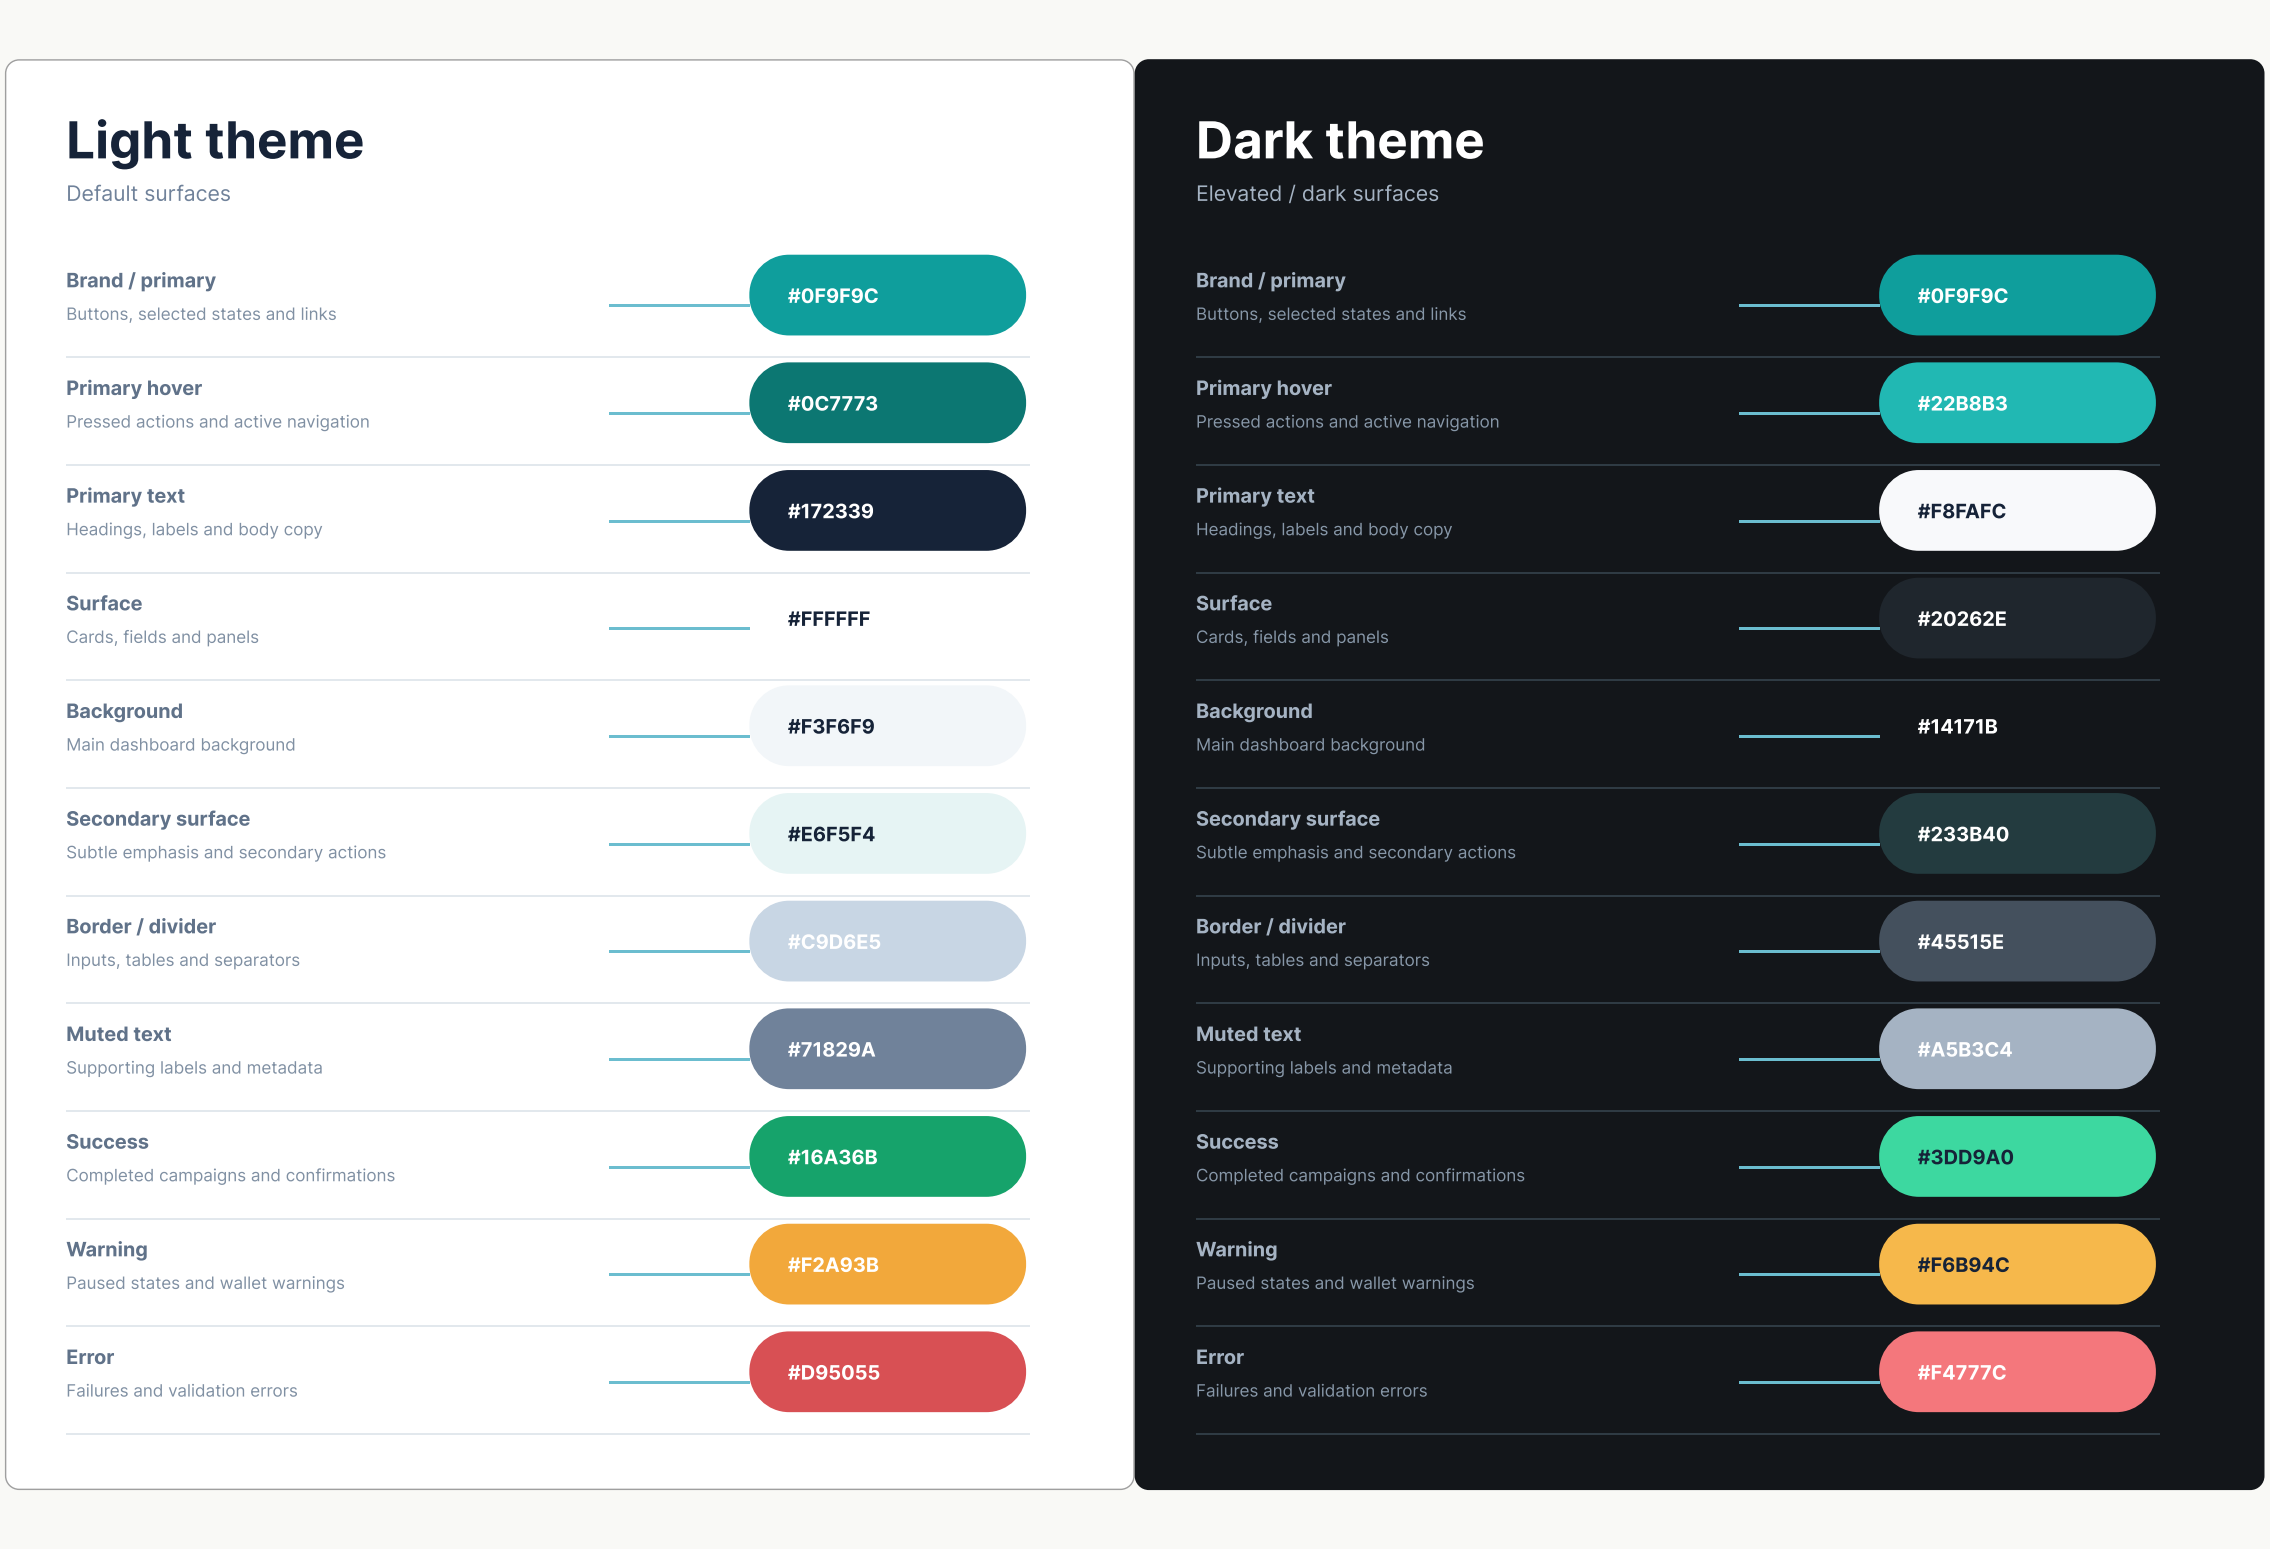
Building a design system is an ongoing process. I started by creating a visual style guide and reusable component library, which expanded as new screens and workflows were designed.

The design system became the foundation for my UI work, helping maintain consistency across the platform while making future designs easier to scale and maintain.

Colours



Light theme
Default surfaces

Token	Use	Colour
Brand / primary	Buttons, selected states and links	#0F9F9C
Primary hover	Pressed actions and active navigation	#0C7773
Primary text	Headings, labels and body copy	#172339
Surface	Cards, fields and panels	#FFFFFF
Background	Main dashboard background	#F3F6F9
Secondary surface	Subtle emphasis and secondary actions	#E6F5F4
Border / divider	Inputs, tables and separators	#C9D6E5
Muted text	Supporting labels and metadata	#71829A
Success	Completed campaigns and confirmations	#16A36B
Warning	Paused states and wallet warnings	#F2A93B
Error	Failures and validation errors	#D95055

Dark theme
Elevated / dark surfaces

Token	Use	Colour
Brand / primary	Buttons, selected states and links	#0F9F9C
Primary hover	Pressed actions and active navigation	#22B8B3
Primary text	Headings, labels and body copy	#F8FAFC
Surface	Cards, fields and panels	#20262E
Background	Main dashboard background	#14171B
Secondary surface	Subtle emphasis and secondary actions	#233B40
Border / divider	Inputs, tables and separators	#45515E
Muted text	Supporting labels and metadata	#A5B3C4
Success	Completed campaigns and confirmations	#3DD9A0

Optimised for scanning data-rich SaaS interfaces.

HEADING / LARGE
Manage your WhatsApp campaigns with clarity

HEADING / MEDIUM
Monitor campaign delivery, read rates and performance.

Inter keeps labels, tables and complex campaign states legible and consistent across the WhatsApp AI platform.

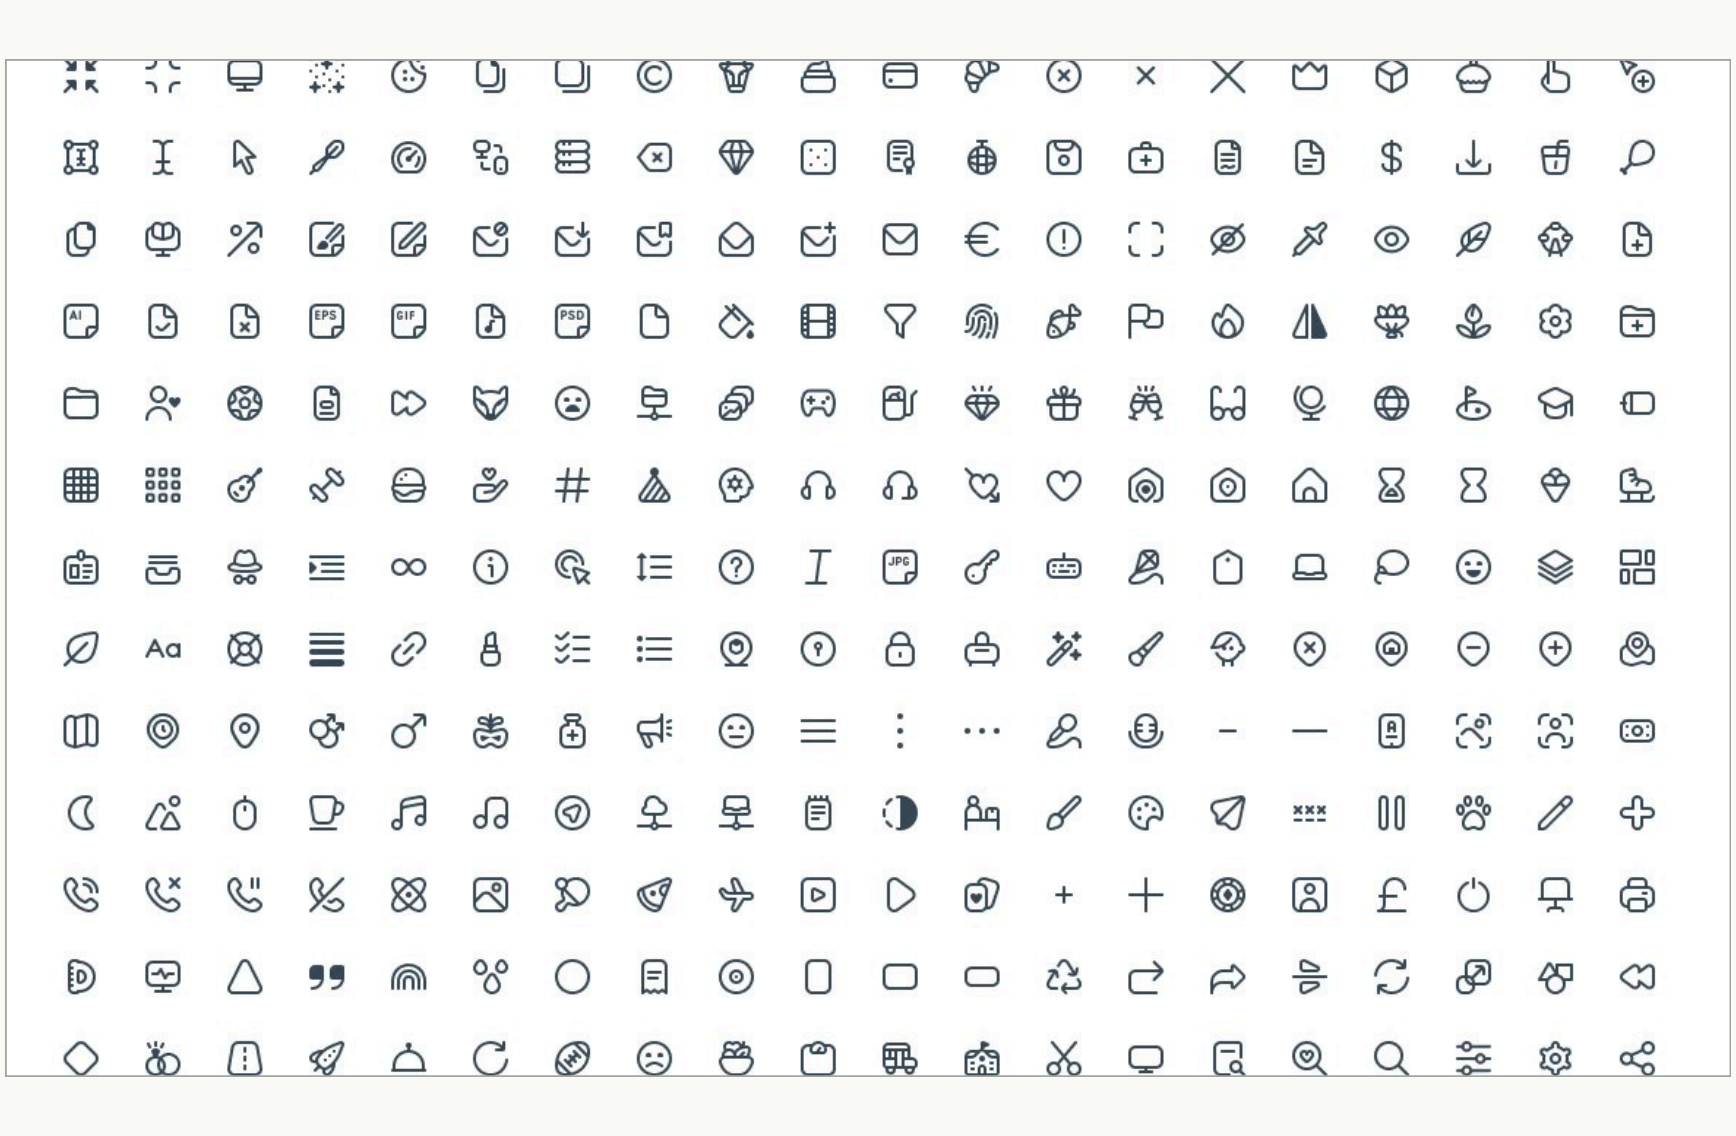
Icons

A minimal icon system for the WhatsApp AI automation platform. Softly rounded corners, consistent stroke weights and clear silhouettes improve recognition across dense workflows.

ICON STYLES
One icon family
Outline only · 1.5px stroke
Rounded caps and joins

ICON SIZES
24px

CORNERS
Slightly rounded · 2px stroke



Illustration

Illustrations

Friendly, minimal illustrations help make complex AI and WhatsApp automation workflows easier to understand.

VISUAL LANGUAGE
Thin, dark-grey outlines with softly rounded corners. Flat geometric shapes and light backgrounds keep the illustrations simple, while expressive characters make the platform feel approachable.

COLOUR STORY

ILLUSTRATION GUIDELINES
Illustrations combine dark-grey outlines with simple filled shapes. The palette is primarily teal, white and soft mint, with orange and olive-green accents used selectively. Minimal details and softly rounded geometry keep the artwork friendly and easy to recognise.

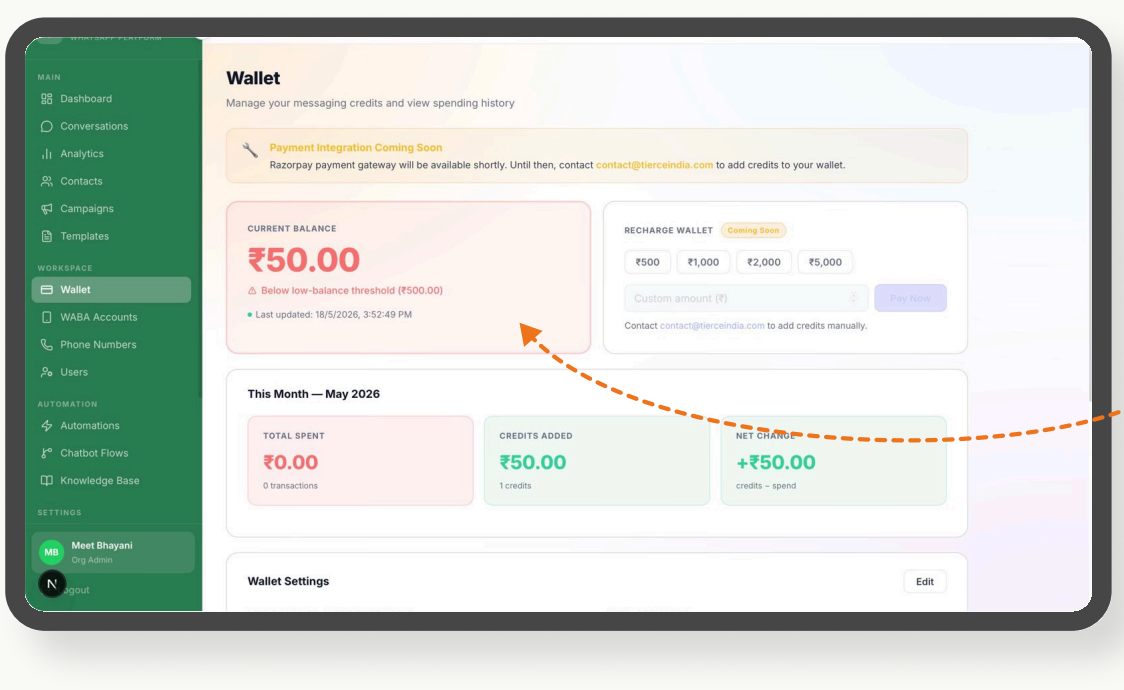
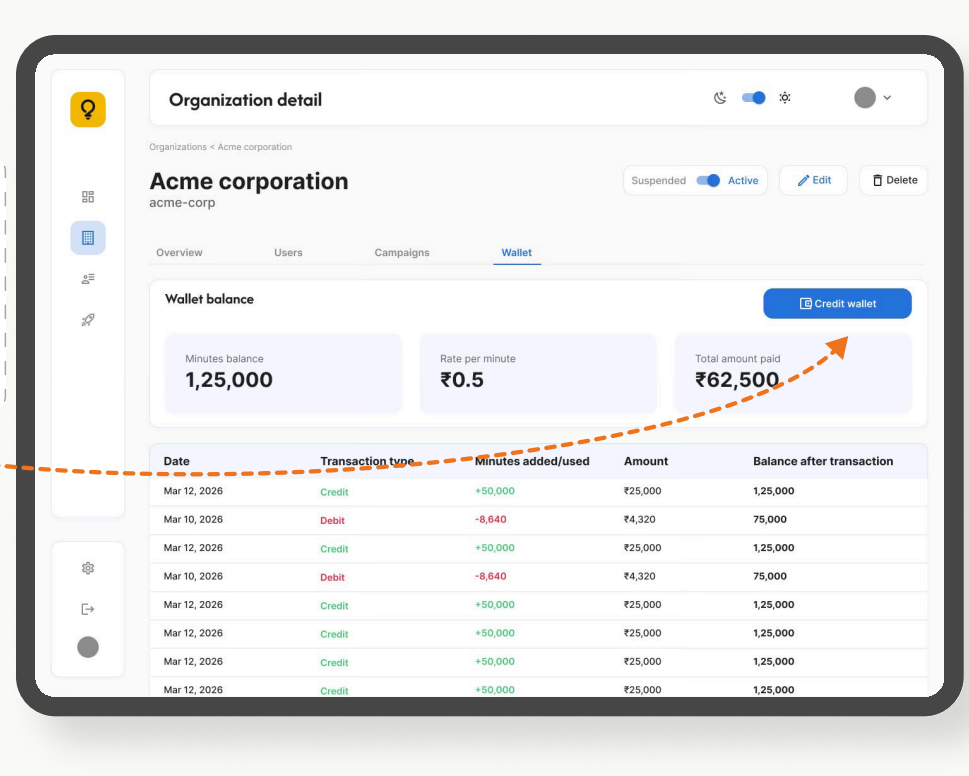
How I Redesigned the Wallet to Make Credit Usage and Balance Easier to Understand

Before



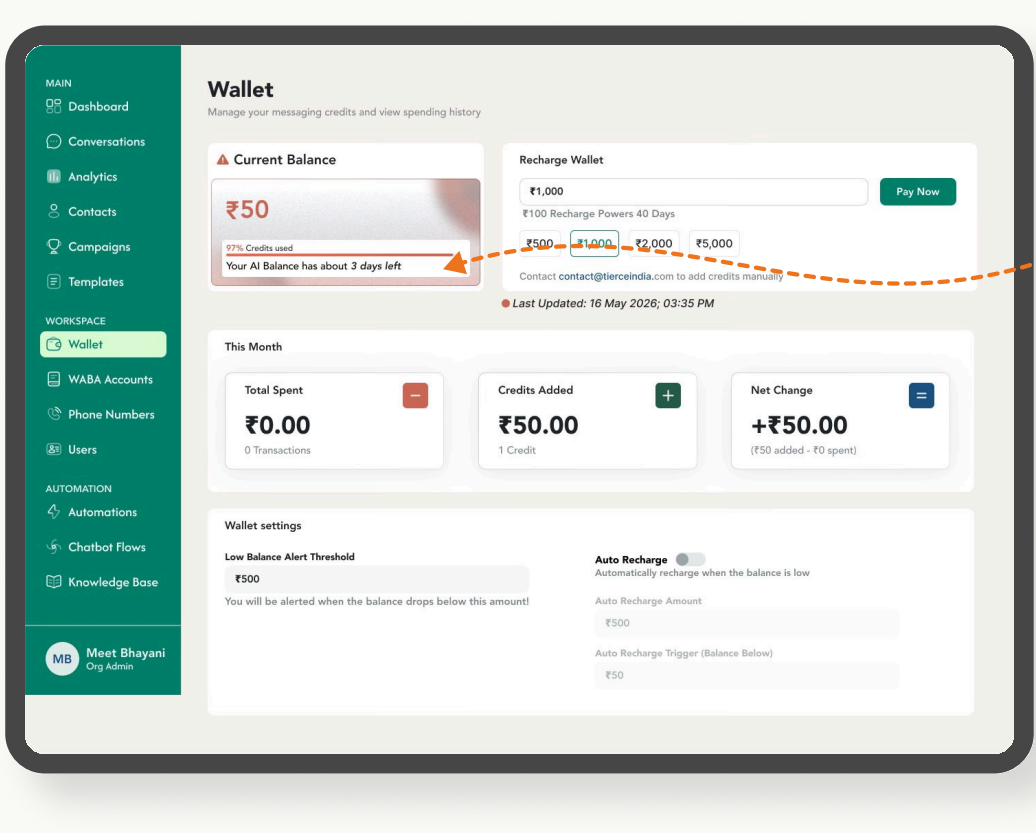
Wallet lacked clarity on credit usage and remaining balance.
- No clear distinction between used and remaining credits.
- Recharge amounts lacked estimated usage duration.
- hard to quickly understand the wallet's current status.

Iteration 01



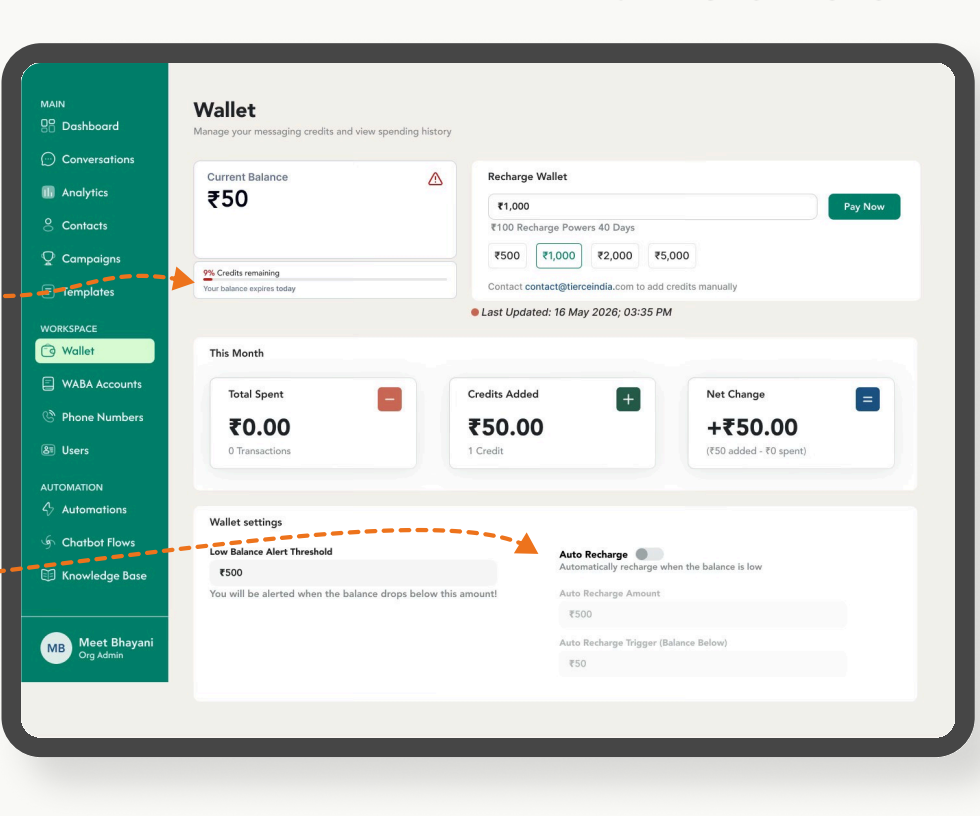
Separated wallet recharge from balance information to reduce clutter
- Added a dedicated button for credit recharge.

Iteration 02



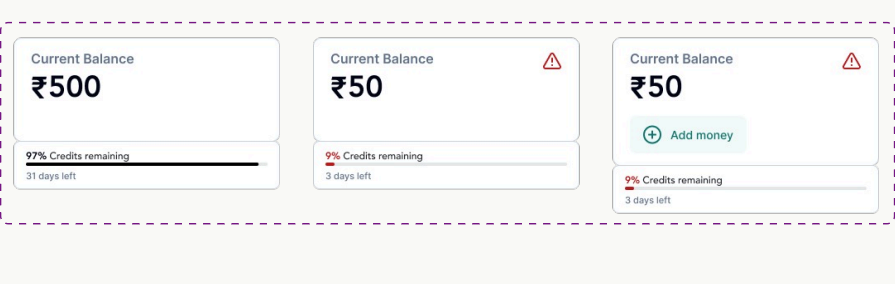
Progress Bar Failed to Communicate Low Credits
- **Design decision:** Added a progress bar to visualise used and remaining credits.
- **What didn't work:** The bar shortened as usage decreased, meaning it appeared fuller when credits were running low.

Final screen



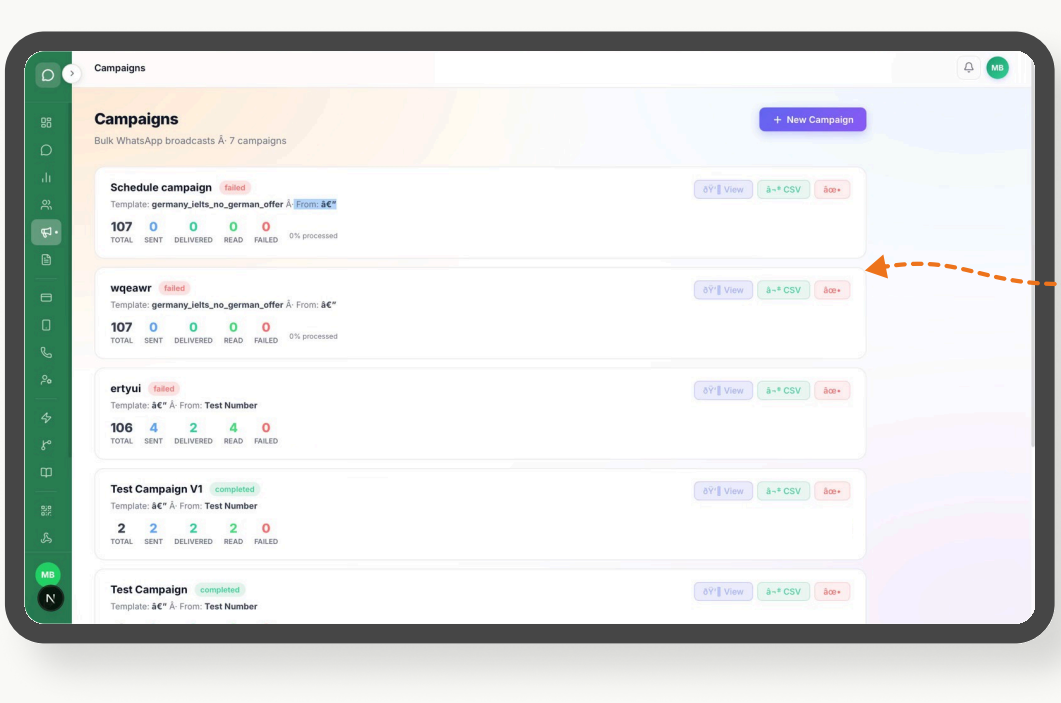
Redesigned the Progress Bar to Clearly Indicate Low Credits
- **Design decision:**
  Reversed the progress bar to shrink as credits run low.
- **What improved:** Users can now recognise low credits at a glance
- **Additional change:** Added an auto-recharge toggle for better user control.

Different states



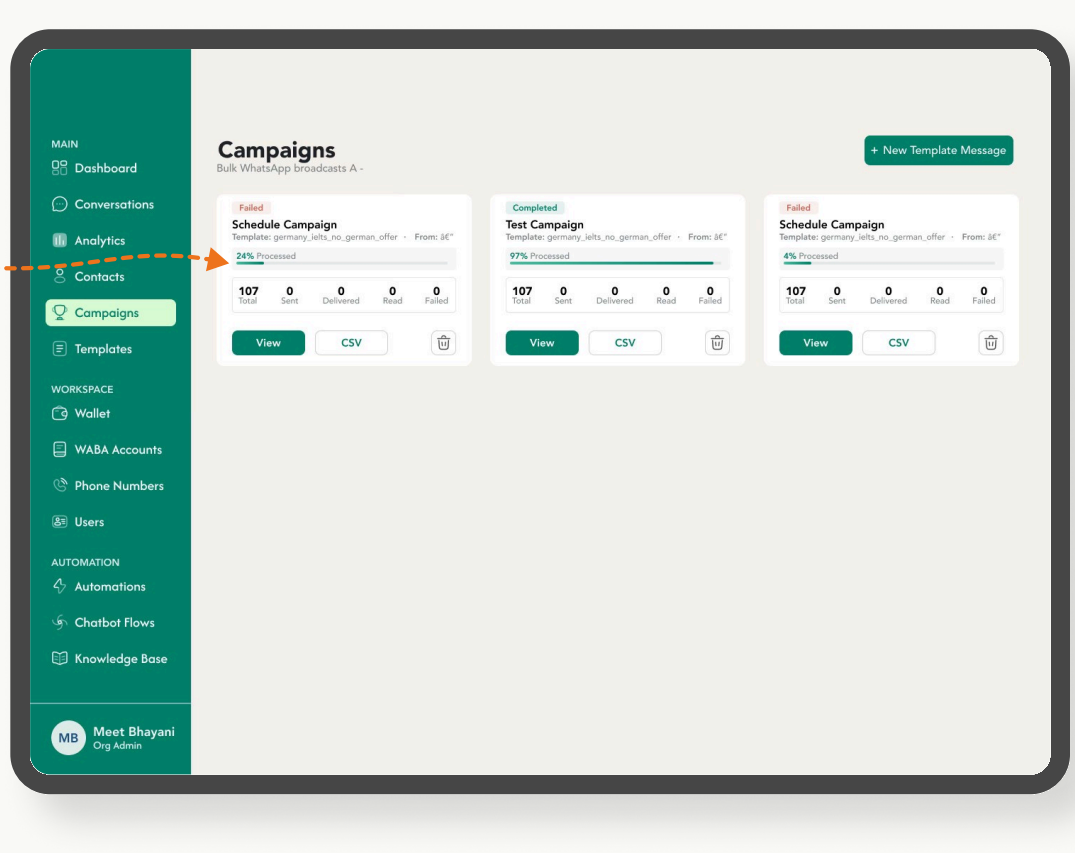
Redesigning Campaign Cards to Make Status, Progress and Metrics Easier to Scan

Before



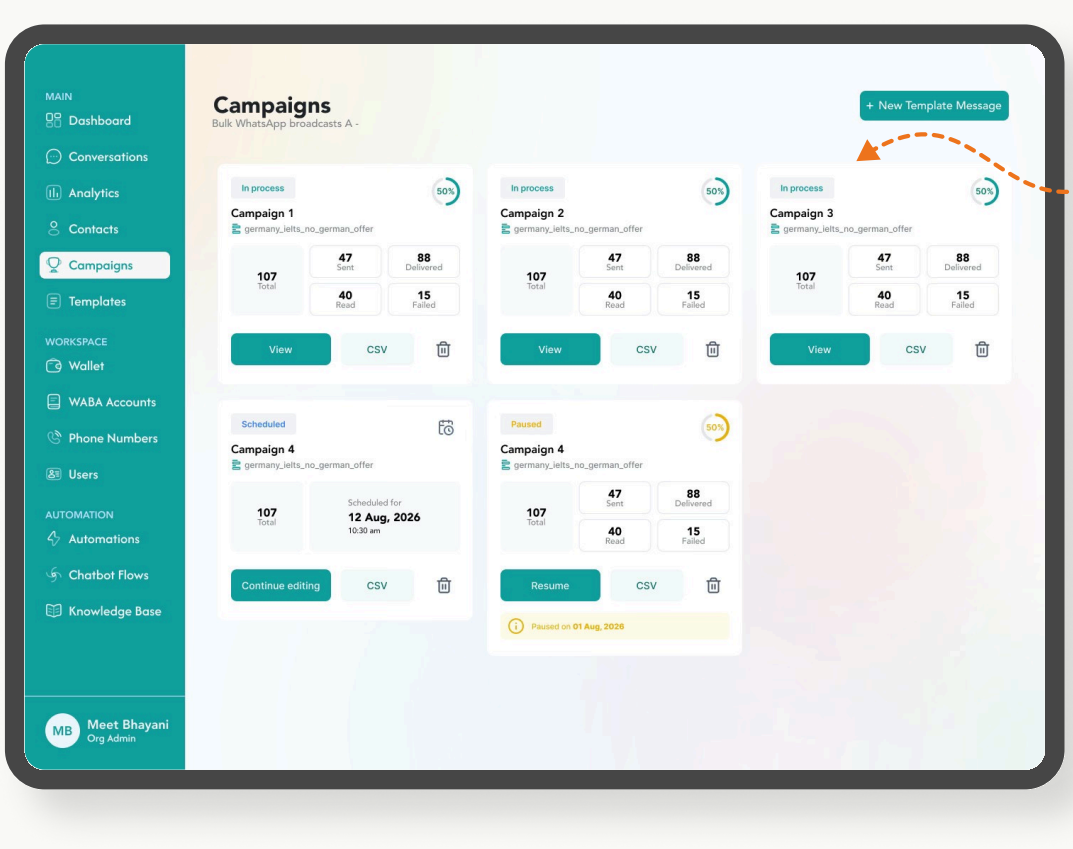
Campaign cards occupied too much space and lacked clear information hierarchy
- Each card took up excessive vertical space.
- Existing status tags were not visually prominent.
- Campaign progress was difficult to interpret at a glance.

Iteration 01



Improved status visibility through repositioned tags and progress bars
- **Design decision:** Moved status tags to the top and added progress bars to highlight campaign completion.
- **What didn't work:** Delivery metrics lacked visual separation, making individual counts harder to scan.

Final screen



Replaced Linear Progress Bars with Circular Indicators
- **Design decision:** Separated metrics for clearer distinction and used circular indicators to save space.
- **Why:** The cards already contained too much information, making them difficult to scan.
- **What improved:** Clearer campaign progress, reduced clutter and easier access to state-specific actions.
